## Feedback Information

At Cisco Press, our goal is to create in-depth technical books of the highest quality and value. Each book is crafted with care and precision, undergoing rigorous development that involves the unique expertise of members from the professional technical community.
Readers' feedback is a natural continuation of this process. If you have any comments regarding how we could improve the quality of this book, or otherwise alter it to better suit your needs, you can contact us through e-mail at feedback@ciscopress.com. Please make sure to include the book title and ISBN in your message.
We greatly appreciate your assistance.

## About the Author

Wendell Odom, CCIE No. 1624, is a senior instructor for Skyline Advanced Technology Services (www.skylinecomputer.com), where he teaches a wide variety of introductory and advanced-level Cisco Systems networking courses. He has been in the networking industry for more than 20 years, working in both presale and postsale technical roles, as well as teaching networking concepts to beginners and CCIE candidates alike. Wendell is the author of numerous best-selling Cisco Press exam study guides, several of which focus on the Cisco Systems introductorylevel certification: CCNA. His most recent works include CCNA INTRO Exam Certification Guide, CCNA ICND Exam Certification Guide, and Cisco DQOS Exam Certification Guide.

## About the Technical Reviewers

Blair Buchanan's career in telecommunications has spanned nearly 30 years, during which time he has written communication software, participated in ISO standards development, and established a successful consultancy. Blair's involvement with Cisco began in 1991 when he designed his first router-based internetwork for the Canadian Department of National Defense. Shortly after, with the help of Cisco Canada, he became the world's first Learning Partner-based Cisco instructor. That company, Protocoles Standards de Communications (PSC) later merged with the U.S. firm Protocol Interface (PI) to form GeoTrain, which was acquired by Global Knowledge in 1999.

In April 1996, and on his first attempt, Blair earned his CCIE certification and became the $403{ }^{\text {rd }}$ CCIE, No. 1427 . Since then, he has designed and audited internetworks for a variety of clients in both the enterprise and service provider sectors. His clients include Nortel Networks, the Government of Canada, Bell Canada, the Government of British Columbia, the Bank of Canada, PSINet, and Mouvement Desjardins.

Dr. Ron Kovac is currently employed with the Center for Information and Communication Sciences at Ball State University in Muncie, Indiana, as a full professor. The Center prepares graduate students in the field of telecommunications. Previous to this, Dr. Kovac was the telecommunication manager for the State of New York and an executive director for a large computing center located on the east coast. Dr. Kovac's previous studies included electrical engineering and education. Dr. Kovac has numerous publications and has done consulting in both the education and telecommunications fields, speaks worldwide on issues related to telecommunications, and holds numerous certifications, including the CCNA, CCAI, and the almost complete CCNP.

Paul Negron is a senior instructor with Skyline Advanced Technology Services, teaching authorized Cisco training courses to a wide range of audiences. Paul teaches the Implementing Cisco QoS course and advanced courses on topics such as BGP, MPLS, high-performance routing, and other CCNP courses.

Scott Van de Houten, CCIE No. 1640, is a distinguished systems engineer for the Technical Operations Group at Cisco Systems. He is currently a technical lead for the Enterprise Routing and Switching Technology Leadership Program. His responsibilities include developing customer requirements for the product teams and customer technical consulting. Scott has been with Cisco for 11 years and has worked as a network engineer for 17 years.

## Dedications

For Fay and Raymond, my favorite parents, out of all the parents I've ever met.

## Acknowledgments

The process of creating a technical book requires a lot of hard work from a lot of people. I am always amazed at how much the various editing processes improve what I first submit as the text for a book. I'd like to take this opportunity to thank some of the people who have had a big hand in putting this book together.

For this book, I was fortunate to have a great team of technical editors. A handful of technical folks get the opportunity to read over the text and the figures, and make comments. Their primary job is to help make sure that the book is technically accurate, but the good ones also make sure that the topics flow well together and would make sense to the reader. While they all did the core job well, in particular, my buddy Paul Negron, also from Skyline Advanced Technology Services, edited the book, and did a particularly good and gracious job of pointing out when I should change the flow between topics. Scott Van de Houten gets the award for the best tech editor at finding my technical mistakes, while offering lots of good analogies that I added to the text. Blair Buchanan did a nice job keeping the text appropriate for audiences outside the United States. And Dr. Ron Kovac excelled at watching the tone, thinking hard about the audience for the book at each step, and really helping the overall flow of topics.

This book posed a unique challenge compared with previous books because it is intended for people who have no direct experience with networking. Dayna Isley, who worked as the development editor for the book, not only did an excellent job managing the entire book-writing process, but she also did a great job helping me find the right depth for the topics in the book. Dayna provided countless great suggestions on the approach and tone of the book.

Brett Bartow worked with me on this book from initial concept, including working through refining the First-Step Series goals as well as the goals for this book. As always, Brett did a great job dealing with the full life cycle of what it takes to get the book done right.

Typically, I'm directly involved with the development editor, executive editor, and the technical editors. However, lots of people work behind the scenes - at least behind the scenes to me-to help to make the book better. Karen Gill did the copyediting, cleaning up some of the wording and flow with a fresh set of eyes. Patrick Kanouse's production team gets involved in the details of how the book will look on paper, managing the process of getting the book laid out, ready for the printer, and finally into the warehouse. In particular, San Dee Phillips took care of the project-editing tasks, managing the book's progress from completed draft until it was ready for the printer. To the people who made the book come together, thanks very much.

On the personal side, I'd like to acknowledge my lovely wife's contributions to the writing process once again. She's always a steadying force when the writing process gets to me. Thanks again, Doll! Also, no set of acknowledgments of mine would be complete without saying thanks to Jesus Christ, savior, friend, brother, and provider.

## Contents at a Glance

Introduction ..... xxii
Part I Networking Basics ..... 3
Chapter 1 What Is a Network? ..... 5
Chapter 2 A Network's Reason for Existence ..... 17
Chapter 3 Building a Network: It All Starts with a Plan ..... 37
Part II Running the Local Department of (Network) Transportation ..... 63
Chapter 4 How to Build a Local (Network) Roadway ..... 65
Chapter 5 Rules of the Road: How to Use the Local (Network) Roadway 87
Chapter 6 Reducing Congestion and Driving Faster on the Local (Network) Roadway ..... 107
Chapter 7 Adding Local (Network) Roadways for No Extra Money ..... 131
Part III Shipping and Logistics: Commerce Using the (Network) Roadways ..... 151
Chapter 8 Shipping Goods over a (Network) Roadway ..... 153
Chapter 9 Choosing Shipping Options When Transporting the Goods over the (Network) Roadway ..... 181
Part IV Navigating the Roadways to Find the Right Street Address ..... 205
Chapter 10 Delivering the Goods to the Right Street (IP) Address ..... 207
Chapter 11 Knowing Where to Turn at Each Intersection (Router) ..... 235
Chapter 12 Painting the Road Signs on Your Interstate (Internetwork) ..... 263
Chapter 13 People Like Names, but Computers Like Numbers ..... 279
Part V Building an Interstate (Inter-LAN) Highway System ..... 293
Chapter 14 Leasing a (Network) Roadway Between Two Points ..... 295
Chapter 15 Leasing a (Network) Roadway Between Lots of Places ..... 315
Chapter 16 Driving from Home onto the Globally Interconnected (Internet) Roadway ..... 333
Part VI Securing the Network ..... 353
Chapter 17 Accepting the Right People and Rejecting the Wrong People ..... 355
Chapter 18 Keeping a Watchful Eye Over Who Drives into Your (Network) Neighborhood ..... 373
Part VII Appendixes ..... 391
Appendix A Answers to Chapter Review Questions ..... 393
Appendix B Converting IP Addresses Between Decimal and Binary ..... 435
Glossary ..... 459
Index ..... 497

## Introduction

Often, learning something new can be a chore, particularly with computer technology. In fact, because you've obviously been searching for a book long enough to at least have opened up this one, you've probably looked at a few other books as well. There's no problem finding networking books - there are tons of thembut almost all of them are geared toward people who want to be networking geeks, and the books frequently get deep and technical in a hurry. They're like the old joke where one guy walks through a door with an unseen long drop to the ground below, and his buddy shouts out, "Watch out for that first step. It's a doozy!"

Computer Networking First-Step is an easy first step toward learning about networking, instead of taking a doozy of a step off the networking ledge. With Computer Networking First-Step, you don't have to worry about the pain normally associated with getting into something new. This book is designed and written assuming that you come to the game with no experience at all with the topics, but with a lot of interest in them.

This book is intended for anyone who needs to know a little about networking, but it also requires almost no prerequisite knowledge. You might want to know a little about networking, but not a lot, because that's all you need to know for your job. For instance, maybe you're in sales, and you need to be able to talk to networking geeks. Or maybe you work in another information technology (IT) area where you talk to the networking folks occasionally, and you need to be able to have more meaningful conversations. Or maybe you want to learn a lot about networking, but you aren't sure where to start. Simply put, if you're getting started with networking, this book is for you. If you've used a computer before, you've got the right prerequisite knowledge coming into this book.

When you finish reading this book, you will know enough to talk to people about how networks operate. You won't be an expert at any one part of networking, but you will understand the basic concepts behind a wide variety of technologies used in a typical network today. If your goal is to have a conversational level of knowledge, this book will do it for you. If your goal is to become a networking professional, but you don't have much knowledge or experience yet, this book will help you start down that path.

Interested? The next few pages will give you a little more detail about what's between the covers. Then you can dive in to the first chapter and start learning about networking!

## There's a Lot Here, but Then Again, There's Not

Computer Networking First-Step covers a lot of topics, so there are many chapters, but each chapter averages 20 pages. And with the book's conversational style, you can grab it when you have 15 spare minutes and complete another chapter. If you're using this book to get started and want to learn networking even deeper, you'll want to take a few more minutes to study the questions and review the terms. In short, you'll find a lot of topics here, but they're pretty much in bitesized pieces for easy digestion.

The part and chapter titles, as well as the headings inside the chapters, are purposefully nontechie. It seems silly to title things using terms that you might not have heard about before. But you might have heard of a few networking terms, so if you want a little better idea of the main topics in each major part of this book and each chapter, take a look at the following comments about what's hidden inside.

## Part I: Networking Basics

Part I covers a broad brush of the basics of networking, with examples referencing tools that many computer users use every day:

■ Chapter 1, "What Is a Network?" -Defines the basic terms, including defining what different people might mean when they use the term "network."

■ Chapter 2, "A Network's Reason for Existence"-Covers networks and networking from a user's perspective.

■ Chapter 3, "Building a Network: It All Starts with a Plan"-Explains the concepts behind an architectural model that vendors use to build networking products and engineers use to implement a particular network.

## Part II: Running the Local Department of (Network) Transportation

After Part I's broad coverage, Part II takes a closer look at the basics of small networks, called local-area networks (LANs), using analogies with how the U.S. Department of Transportation (DOT) builds roads:

■ Chapter 4, "How to Build a Local (Network) Roadway" - Using analogies with how the U.S. DOT builds roads, this chapter shows how to physically construct a LAN using cabling, PCs, and other networking gear.

■ Chapter 5, "Rules of the Road: How to Use the Local (Network) Road-way"-Just as you need to obey traffic laws, data must follow the traffic laws of the LAN. This chapter tells you how to pass a LAN driving test.

■ Chapter 6, "Reducing Congestion and Driving Faster on the Local (Network) Roadway" - It's more fun to drive a fast car. This chapter covers how to do the equivalent with LANs.

■ Chapter 7, "Adding Local (Network) Roadways for No Extra Money"It's free, and it's better in many cases. "It" is a thing called virtual LANs (VLANs), which allow you to create lots of LANs with no additional hardware.

## Part III: Shipping and Logistics: Commerce Using the (Network) Roadways

This part changes the focus to what the end user of a network experiences-the applications. Chapters draw analogies with doing business by shipping goods to market over the roadways:

■ Chapter 8, "Shipping Goods over a (Network) Roadway" - This chapter focuses on applications that the end user of a network uses - things that you have probably already done yourself, such as use a web browser to look at a website.

■ Chapter 9, "Choosing Shipping Options When Transporting the Goods over the (Network) Roadway" - Behind the scenes, applications need services from other things in the network, just like most companies use a large shipping company for shipping products. This chapter looks at those basic services.

## Part IV: Navigating the Roadways to Find the Right Street Address

The person driving the shipping truck needs to get to the right street address. Part IV covers the equivalent idea in networking, defining how data is delivered across any network, including the Internet:

■ Chapter 10, "Delivering the Goods to the Right Street (IP) Address"Internet Protocol (IP) defines logical addresses - the equivalent of a street address. This chapter defines how networking devices together deliver data from one computer to another using IP addresses.

■ Chapter 11, "Knowing Where to Turn at Each Intersection (Router)"One of the more important types of networking devices is called a router. This chapter covers how routers work, with analogies drawn to how a driver makes decisions about where to turn at each intersection.

■ Chapter 12, "Painting the Road Signs on Your Interstate (Internet-work)"-If you take a trip, you might rely on road signs to tell you where to turn. Routers can do the networking equivalent of posting road signs, which is explained in this chapter.

■ Chapter 13, "People Like Names, but Computers Like Numbers"Let's face it: Computers are better at math than we are. This chapter explains how networks let us use names (such as www.ciscopress.com), and how the computer converts those names to numbers that are more useful to the computer.

## Part V: Building an Interstate (Inter-LAN) Highway System

When computers in the network are far apart, the physical connections are called wide-area networks (WANs). This part explains three major branches of WANs, all of which require that you lease someone else's physical network because of the impracticality of having everyone run cables for hundreds of miles:

■ Chapter 14, "Leasing a (Network) Roadway Between Two Points" This chapter covers how two routers at two different physical sites can send data using the equivalent of a never-ending telephone call between the two routers.

■ Chapter 15, "Leasing a (Network) Roadway Between Lots of Places"If you have more than two routers at different sites, it's cheaper to use a different type of WAN, called Frame Relay, as explained in this chapter.

- Chapter 16, "Driving from Home onto the Globally Interconnected (Internet) Roadway"-Most everyone knows about the Internet. But what really happens when you connect to the Internet from home? This chapter covers the high points.

## Part VI: Securing the Network

This part highlights how to protect your network from both the curious and the malicious people on the Internet:

■ Chapter 17, "Accepting the Right People and Rejecting the Wrong People" - You shouldn't just let anyone use a network. This chapter hits the key points of how to make sure only the right people use your network.

■ Chapter 18, "Keeping a Watchful Eye Over Who Drives into Your (Network) Neighborhood" - This chapter covers how to set up ground rules for what's allowed into your network from the Internet, and how to watch for crackers who might try to cause harm to your network.

## Part VII: Appendixes

- Appendix A, "Answers to Chapter Review Questions"-Each chapter ends with a "Chapter Review Questions" section that contains some openended questions. This appendix repeats the questions and lists answers as well.
- Appendix B, "Converting IP Addresses Between Decimal and Binary" - The coverage of IP in Chapter 10 doesn't require you to think about IP addresses in binary. However, for any of you who are interested in learning networking more deeply after reading this book, this appendix can help you with some of the basic math relating to IP addressing.

## Glossary

The college professor who first taught me about networking, Dr. Phil Enslow, used to say that 80 percent of networking was understanding the lingo and then understanding how other people used the same lingo. The Glossary will be a valuable tool as you build up your lexicon for having conversations about networking.

## Who Ought to Read This Book

This book is meant for anyone who wants a comfortable introduction to a broad variety of networking topics. That's not to say this book doesn't tell you some important technical details, because it does. Primarily, this book is purposefully designed for people who want a solid understanding of the basics of networking, plus a good working knowledge of the terminology that networking professionals use every day.

That said, there are a few specific types of people who come to mind that will especially benefit from this book:

People who are beginning their quest to become networking techies. Anyone who wants to work in the computer networking arena has to start learning somewhere, and this book is an excellent starting point. Whether you are in school and using this book as part of a course, or you are learning on your own, this book can start you on a career in networking.

IT professionals who are looking to know more about networking. If you're already in the IT arena but don't know a lot about computer networking, this book can help you as well. You've probably already heard a fair amount of the lingo used by networking types, but now you want to know what they really mean by it all. This book is for you! It covers hundreds of terms with explanations in the context of how you normally build a corporate network.

People who need to talk to the people who build networks, but who have no need to know how to build networks themselves. Lots of people have jobs that require them to have a general idea about how networks work, but without needing to make them work. For instance, businesses that sell networking hardware and software have people who work for them - salesmen, accountants, operations, consultants, customer service reps, and administrators - and all of them can benefit from knowing a little about networking. Also, some companies don't sell hardware and software, but they sell services that rely completely on networking. Insurance companies, banks, shipping companies, and many others rely on their networks for the core business functions. If you want to understand what the network engineers are saying, this book will help!
People who want to pass networking certification exams but who need more background. If you want to get some good résumé material so that you can get a job in networking, you should try to get some networking certifications. Many people need a little more background before diving into the books and courses related to entry-level networking certifications, and this book can help.

## Still Hungry? Try Another First-Step

Some of you might be thinking something like, "Well, I already know something about networking, and maybe this book can fill in some holes. I really like the approach and comfort of using this book, but what I really want to know a lot about is security, and there are only two chapters on security. What I really need is a First-Step book on computer security!"

Well, if you really thought that, the book Network Security First-Step is meant for you. Cisco Press introduced the First-Step Series in the spring of 2004. You can check http://ciscopress.com/firststep for more information on any new titles. The goal of the First-Step books is to provide an easy first step into whatever networking technology is covered by the book. Each First-Step book meets you at the beginner stage for the technologies in the book. For instance, Network Security First-Step covers some of the basics of a protocol called TCP/IP, but it focuses specifically on network security.

## Stuff You'll Find in This Book

This book includes several features to help you digest the materials with minimal heartburn. With the solid foundation gained through this book, you can learn things about new technology more easily, talk networking with others, or be better prepared to begin a career in networking:

■ Chapter objectives-Every chapter begins with a list of objectives that are addressed in the chapter. The objectives are revisited in the chapter summary.

■ Highlighted keywords and Glossary - Throughout this book, you will see terms formatted with bold and italics. These terms are particularly significant in networking. So, if you find you aren't familiar with the term or at any point need a refresher, simply look up the term in the Glossary toward the end of the book to find a full definition.

■ Chapter summaries-Every chapter concludes with a comprehensive chapter summary that reviews chapter objectives, ensuring complete coverage and discussing the chapter's relationship to future content.

■ Chapter review questions-Every chapter concludes with review questions. These questions test the basic ideas and concepts covered in each chapter. You can find the answers to the questions in Appendix A.

■ Nontechie headings and titles - The titles and headings used throughout this book avoid the use of technical terms when possible, focusing instead on words that connote something about the underlying concepts.

The illustrations in this book use the following icons for networking devices and connections:

PC

Router

Switch

Printer

Web Server

Hub

File Server

Phone

## For More Information...

If you have any comments about this book, you can submit those through the ciscopress.com website. Simply go to the website, select Contact Us, and type in your message.

I hope you enjoy your first step into a deeper knowledge of networking, and I trust that these first steps will be a doozy of a good learning experience!

This page intentionally left blank

## What You Will Learn

After reading this chapter, you should be able to
$\checkmark$ Explain how computers can communicate binary 1s and 0s using electricity
$\checkmark$ List the components of popular LAN cables and connectors

- Compare and contrast straight-through and cross-over Ethernet cables
- Explain the operation of an Ethernet hub
$\checkmark$ Summarize the benefits of using a structured cabling system

## CHAPTER 4

## How to Build a Local (Network) Roadway

So far in this book, you have read about how networks allow computers to communicate. Networks include software, some of which sits in the computers, and some of which sits in routers. The network also includes hardware, such as the network interface cards (NICs) in the PCs, mentioned in Chapter 3, "Building a Network: It All Starts with a Plan." Finally, networks include cabling, which provide a physical means to transmit bits across a network.

This chapter is the first one in this book's second major part: "Running the Local Department of (Network) Transportation." In the United States, most cities, all states, and the U.S. federal government have a department of transportation (DOT). Each DOT plans, builds, and fixes problems with roadways. You can learn a lot about networking by comparing networks to roads.

## Driving Bits Across the Network Roadway

I just got back from lunch at one of my favorite lunch places: La Frontera Mex-Mex Grill. When it was time for lunch, I got in my car, drove to the restaurant, ordered my usual - numero dos, con pollo, por favor-and drove back home.

When I got home, my wife said, "So you drove over that really cool street outside our house on your way to lunch, huh?" Yeah, right. Who cares what roads I drove on? It's where I drive to that's important.

Well, to know networking well, you need to know some of the basics about the networking equivalent of roads. If you find yourself really getting interested in what's in the next few pages, you might just be one of those people who really would like a career working with the technical side of networking. If not, you should at least know the concepts so that you can communicate with the networking geeks of the world and have a firm understanding of networking.

## What's a Local-Area Network?

Chapter 3 defined a local-area network (LAN) as a network in which the devices are relatively close together. Of course, a network, once again according to this book, includes computers, software, hardware, and cabling that allow the computers to communicate. Although this definition is accurate, you really do not get a detailed picture of a LAN this way. So, Figure 4-1 shows a LAN, which is one you've seen before in Chapter 3.

Figure 4-1 Components of a Simple LAN

In this case, the LAN consists of some obvious elements. First, you need at least two computers. The computers need to have networking software; otherwise, they will never attempt to communicate. They also need the physical ability to transmit bits from one computer to the other-hence the need for the cable and the NICs in each computer. (Figure 4-1 shows the NICs outside the PCs so that you can see them, but they are typically inside the PCs.)

LANs do not get any simpler than this one. Larger LANs can get much more complex, with lots more components like networking hubs and switches, which you will learn more about in the next few chapters.

In this chapter, you learn about how computers can transfer bits across the network roadway. The topics covered here might be the equivalent of what a DOT engineer might talk about over lunch with a stranger: "Hey, you know we're going to be paving Parker-Puckett Parkway pretty soon. Pretty cool, huh?" The reply, "Hey, isn't that near that Mexican place, La Frontera?" And the response from a true DOT engineer: "I don't know - don't care. That's beside the road. I just care about the road." Likewise, some network engineers think of the LAN as the cable, possibly the NICs, but they typically don't care a lot about the computers that happen to be connected to the cabling. Likewise, this chapter focuses more on how computers send bits to each other, rather than the applications that run on those computers.

## Transmitting Bits Across the Local Network Roadway

Back in Chapter 2, "A Network's Reason for Existence," you saw an example where Fred opened a file that sat on Wilma's disk drive. Later, Fred printed the file on the printer connected to Wilma's computer, and finally, Fred saved the file back on Wilma's disk drive. Figure 4-2 shows the process, in sequence.

Figure 4-2 Basic Flow with Fred Using a File/Print Server

Wilma's PC

For this process to work, Fred and Wilma must be able to cause a bunch of bits that sit in memory in one computer to be sent to the other computer. A file is just a bunch of bits. So, imagine that by using a word processing program on a single computer, you can open a file, read the contents, and edit and change the file. Similarly, if you can send the same bits in that file to another computer across the network, you or someone else can edit the file by using the same word processing program on that computer. So, for a network to work, the network needs to be able to get a bunch of bits from one computer to another.

## Driving Bits Across a Wire

To send one binary code from one device to another, the sending device puts some electricity on the wire. Electrical signals have many characteristics that a NIC can control and vary. By varying one of these features to two different values, with one value meaning binary 1 and one meaning binary 0 , you can transfer data over the wire.

For example, imagine that both PC1 and PC2 have a NIC, and there is a single wire connecting the two cards. The wire is just a skinny, long piece of copper, and copper conducts electricity very well. Now, imagine that the encoding standard used by the company that made the NIC defines that a binary 0 is represented by a voltage of $\pm 5$ volts, and a binary 1 is represented with $\pm 10$ volts. Encoding is the term that refers to a set of rules that defines what a sender should make the electrical signal look like to imply a binary 0 or a binary 1 . Figure $4-3$ depicts the general idea.

Figure 4-3 Basics of Data Transmission Across a Wire

In the figure, PC2 generates some electricity on the wire. In this case, PC2 wants to send the binary value 0101 . So, it sends a 5 -volt signal, then 10 volts, then 5 volts, and then 10 , because the imaginary encoding scheme in this example states that 5 volts means 0 , and 10 volts means 1 . PC1, on the other end of the wire, senses the incoming electrical signal and interprets the electricity, using that same set of encoding rules to mean 0101, exactly as PC2 intended.

Note that the graph shown in Figure 4-3 shows a discrete, or constant, voltage. Because the X -axis (horizontal axis) represents time, when the voltage changes, it changes immediately to the next value. The use of discrete, constant values, which are then instantly changed to other possible discrete values (as in Figure 4-3), is called digital transmission. To transmit binary numbers, or binary digits, it is useful to transmit the data using digital transmission.

For the digital transmission of data to work correctly, not only must the sender and receiver agree to what electrical characteristics mean a binary 0 or 1, but they also must agree to the rate at which the bits are transmitted over the wire. In Figure 4-3, the receiver ( PC 1 ) must think about the electrical signal at different points in time, on a regular interval. Likewise, the sender (PC2) must use this same regular time interval to decide when it should change the digital electrical signal. For instance, if PC2 varied the voltage to mean either 0 or 1 every .1 seconds, and PC1 sampled the incoming electrical signal every .1 seconds, they could transfer 10 bits in a second. The speed of this network connection would be 10 bits per second.

If the two PCs did not agree on the transmission speed, the devices couldn't transfer the binary information. For instance, imagine that PC2 thought the speed was 10 bits per second, meaning it should encode a new bit every $1 / 10$ of a second. If PC1 thought that it should be receiving a bit 20 times per second, it would sample the incoming electrical signal every $1 / 20$ of a second. PC1 would think it was sending 10 bits each second, and PC2 would think it received 20 bits.

The term bps (short for bits per second) often refers to the speed of networking connections. Note that the unit is bits, not bytes. In real life, LANs typically run at much higher speeds, with a slow LAN transmitting at 10 million bits per second (Mbps, also called megabits per second).

Notice that Figure 4-3 represents electricity as a square waveform, with positive and negative voltages. You don't really need to worry about the electrical details, but as you progress through learning about networking, you will see other drawings like this one. The networking cards use an alternating current, or AC. The positive voltage means the current is in one direction, and the negative current means the current runs in the opposite direction.

## The Need for a Two-Lane (Network) Road

In Figure 4-3, PC2 sends an electrical signal to PC1. As it turns out, if PC1 tried to send some electricity to PC2 at the same time, over the same wire, the electrical signals would overlap, and neither PC1 nor PC2 could understand what was sent.

To solve the problem, PC1 and PC2 need to use two wires - one for PC1 to send bits to PC2, and one for PC2 to send to PC1. Figure 4-4 shows two wires, with PC1 and PC2 sending and receiving at the same time.

Figure 4-4 Concurrent Data Transmission Across Two Different Wires

## The Equivalent of Asphalt: Cables

You can get in your car and drive around your yard, the sidewalk, in your neighbor's yard, or through the park. Of course, it's better if you drive on the road! The earlier examples in this chapter showed NICs using a single copper wire for data transmission in each direction. But rather than just have a couple of wires somehow stuck into the side of the cards, in real life, we use cabling and connectors to manage the wires, making the job of the electrician much more comfortable and convenient.

The copper wires that networking cards use are encased inside a cable. The cable is made from plastic, with the copper wires inside the cable. Figure $4-5$ shows a drawing of the most popular type of cabling used for LANs today.

Figure 4-5 Typical LAN Cable

## UTP Cable

If you look closely at this figure, you can see each copper wire, as well as the plastic coating on the wire. The copper wire is thin, making it brittle. In fact, the wire could easily break in your hand. To help prevent the wire from breaking, a thin plastic coating is painted onto each wire. Conveniently, each wire uses a different color of plastic coating, so you can look at each end of the cable and figure out which wire is which. As you might guess, and as you will learn more about in the next few pages, it is important that you can identify a particular wire on each end of the cable.

Also note that the wires in Figure 4-5 are twisted together in pairs. Each pair of wires is cleverly called a twisted pair. The term refers to a pair of wires twisted around each other to reduce the amount of electrical interface on the wires. In layman's terms, electromagnetic interference (EMI) occurs when electrical signals that exist in the air-caused by other wires or other nearby electrically powered devices - change the electrical currents on the wire. If outside EMI changes the signal on the wire, the receiving computer might misinterpret a 0 as a 1 or a 1 as a 0 , or it might not have a clue what the sender really sent. Sending the electrical signals over a twisted pair rather than a single wire eliminates a lot of EMI effects. (Besides, the wires are pretty skinny anyway, and copper is cheap, so why not use two?)

Another thing that can be added to the cable to reduce EMI is shielding. Shielding, as the name implies, shields the wires inside the cable from the effects of EMI. However, shielded cabling has more stuff in it, making the cable less bendable and more expensive to produce. Shielded cables are called shielded twisted pair (STP), and you could probably guess that unshielded cables are called unshielded twisted pair (UTP). LAN technology has evolved to the point where less expensive UTP cabling can be used in most environments, with STP cabling being used in environments where significant EMI issues exist. Figure 4-5 showed UTP cabling; Figure 4-6 shows an example of an STP cable.

Figure 4-6 Shielded Twisted Pair (STP) Cabling
STP Cable

## Painting the Lines on the Road: Connectors

Imagine that you see a new road that has just been paved. The road is so new that the DOT hasn't even painted the lines yet. So, you turn onto the road and enjoy the ride. After a couple of miles, you look up and see that someone else is on the road - a huge, speeding truck - and the driver wants to take his half of the road in the middle of the road. After swerving off the road, you might think to yourself, "Boy, that reminds me of one of the reasons that you use connectors on the end of networking cables!"

Okay, that's far fetched, but it does lead into a key point about connectors. If roads had no lanes, and there were no traffic laws, the roads would be pretty dangerous so the DOT paints lines on the road to create traffic lanes. Similarly, connectors line up the wires on the end of a cable into well-defined physical locations inside the connector. Essentially, each wire in the cable is identified by color, and each colored wire has a specific reserved place inside the connector that the electrician attaches to the end of the cable. The connectors put the wires into the right place, just like the lines on a road guide cars into the right place.

An electrician can take a cable and attach a connector to the end of it. When he attaches the cable to a connector, each of the wires protrudes into the connector so that the electricity can flow when connected to a device. The tip of the exposed wire in the connector is called a pin. A pin is nothing more than a physical position in the end of the connector in which the copper part of the wire sits. You can think of a pin like you think of a lane on a road. Figure 4-7 shows a photo of a typical connector, called an $\boldsymbol{R J} \mathbf{- 4 5}$ connector, along with a drawing of the same connector.

Figure 4-7 Typical Networking Connector (RJ-45)

The Telecommunications Industry Association (TIA) and Electrical Industries Alliance (EIA) define standards for cables and connectors. For instance, they define how to use an RJ-45 connector for LANs and options for several types of UTP cabling. (You can learn more about TIA and EIA by going to their websites, at http://www.tiaonline.org and http://www.eia.org.)

If you have never seen an RJ-45 connector, and you use Ethernet LANs at work or school, you could remove the cable from your PC's network card and look at it. In most cases, the cable will be using an RJ-45 connector. (Ethernet is by far the most popular type of LAN today. You'll read more about it in the next several chapters.)

The EIA/TIA defines standards for which wires fit into which pins when you make a cable for use with Ethernet. Two of those standards are shown in Figure 4-8.

Figure 4-8 Pinout Options for RJ-45 Connectors

Each of the drawings in the figure represents an RJ-45 connector. The RJ-45 connector allows eight wires to be inserted into it. EIA/TIA standards suggest the numbering schemes for the eight pin locations and the pairs of wires, knowing that a twisted pair is needed for data transmission. The standard also specifies which color of wire goes into pin position 1,2 , and so on.

The RJ-45 connectors have clips on the side that allow you to easily insert the connector into the plug (hole) in the networking card in a computer. At that point, the connector is secure and should stay put. If you push the clip close to the rest of the connector, it releases the connector from the card. So, the clip helps keep the connector secure and allows you to pull the connector out when you are ready.

So, why does all this matter? In the next few pages, it will all come together as you see how NICs try to use the cables and wires.

## Driving in the Right Lane (Pair) on the Road

Refer to the simple network of Figure 4-1 early in this chapter. That network consisted of two PCs, each with a networking card, and a cable between them. So far, you've learned the basics about wires, cables, and connectors. However, there's one last important thing about basic LAN data transmission that you need to know, and it relates to which wires are used for actual data transmission by Ethernet LANs.

Ethernet NICs in PCs try to send data over the twisted pair that uses pins 1 and 2 of an RJ-45 connector. These same NICs expect to receive data on the twisted pair that uses pins 3 and 6 . However, without the right kind of cabling, two Ethernet NICs cannot communicate. Figure 4-9 depicts the effect when both NICs try to send using the twisted pair that uses pins 1 and 2.

Figure 4-9 Both PCs Using the Same Pair (Lane) to Send Data

(Rather than clutter the figure with more cabling, I just drew the two pairs of wires; the wires do indeed sit inside a single cable, with RJ-45 connectors on each end.)

The cable in Figure 4-9 puts one end of a wire in pin 1 of one connector, and the other end into pin 1 of the other connector. Pin 2 on one end of the cable connects to pin 2 on the other side; and so on, for all eight wires. A cable with the wires connected in this manner is called a straight-through cable.

Okay, back to the problem illustrated in Figure 4-9. As you can see from the bubbles in the figure, both PC's NICs send on the twisted pair at pins 1 and 2. That electricity goes over the wires and enters the other NIC on pins 1 and 2. But, the NICs aren't receiving data on pins 1 and 2! That's because Ethernet NICs try to send on pins 1 and 2, and they receive data on the pair at pins 3 and 6. In this case, both PCs send, but neither receives data.

The solution is to use a cross-over cable. Cross-over cables connect the wire at pin 1 on one end of the cable with pin 3 on the other end; the wire at pin 2 with pin 6 on the other end; the wire at pin 3 with pin 1 at the other side; and the wire at pin 6 with pin 2 at the other side. The result: The PCs can receive the data sent by the other device! Figure 4-10 shows the basic idea.

Figure 4-10 PCs Using Different Pairs (Lanes) to Send Data

Now you know the basics of how you can allow two PCs to attach to a cable and transfer bits between each other. This chapter focuses on how to build the local network roadway - essentially, the networking components that allow bits to be transferred. Next, you'll read about how to connect several devices on an Ethernet LAN, using a device called a hub.

## Sharing the Local Roadway: Ethernet Hubs

An old friend of mine is a native of San Francisco and still lives there. The traffic is horrible there, in part due to the need for lots of people to commute across the San Francisco Bay. There simply aren't enough bridges for the number of cars that need to cross the Bay. His solution: Fill in the Bay with dirt and pave the whole thing. Then there would be plenty of roads to allow people to cross the Bay.

If you tried to connect 10 PCs in a network, using a cross-over cable between NICs (as shown in figure 4-10), you would begin to do the equivalent of paving the San Francisco Bay. You know how two computers can use Ethernet NICs with a cross-over cable to communicate. However, to connect to other PCs, you would need more Ethernet NICs, and your PC probably does not have enough room for
all the cards. Also, you would need to run cables between your PC and all the other PCs, or at least get the electrician to run the cables. If you tried to do this for 100 PCs on the same floor of the building, and every PC wanted to connect to every other, you would have 99 cables connected to 99 NICs inside each PC!

The alternative to running a cable to every other PC is to run a cable from each PC to a wiring closet and connect the cables to a networking device, called an Ethernet hub. An Ethernet hub provides several functions, but mainly it allows the electrician to cable each device to the hub using only a single NIC and single cable, eliminating the cabling problem. The hub simply listens for incoming electrical signals, and when received, the hub repeats the same electrical signal to every other device that's connected to the hub. Figure $4-11$ shows the basic operation.

Figure 4-11 Ethernet Hub Repeats Everything It Hears

As seen in the figure, Larry sends data to the hub, and the hub repeats what Larry sent out the cables to Archie and Bob. It's that simple!

Figure 4-11 shows cabling, but it does not show which pairs of wires are used. Interestingly, the hub expects straight-though Ethernet cabling between itself and the PCs. Why is that? Well, the people who make hubs, knowing that Ethernet NICs in PCs send on the twisted pair that uses pins 1 and 2 and receive on twisted pair that uses pins 3 and 6, do the opposite. Therefore, a straight-through cable works between a PC NIC and a hub. Figure 4-12 illustrates the concept.

Figure 4-12 Hubs Use Straight-Through Cabling to PCs

The hub's logic is simple:

1. Receive traffic on pins 1 and 2 on each physical interface.
2. When received, repeat the same electrical signal out all other ports, except the one in which the data was received.
3. When repeating out other ports, repeat the traffic out pins 3 and 6 so that the PCs will be listening.

## Dirt Roads Versus the DOT

You can spend a long time working around or in the networking arena and not ever need to worry about how structured cabling works. This section gives you a brief glimpse into the world of structured cabling, just so you know what people are talking about if they bring it up.

You can go to the store and buy premade Ethernet UTP cables with RJ-45 connectors on them. You can even buy a hub - and for not a lot of money, typically less than $\$ 20$. You could then connect a bunch of computers to the hub using the straight-through Ethernet cables, and voilà, you have a network, or at least the part that allows the computers to send and receive data. Running your own cabling is quick and easy.

In a real network in a real building, you will not typically get away with stringing cables on top of the carpet, over people's cubicles, and so on. Instead, you should allow the electricians to do their job right, which means that the cables will run either under the floor or inside the ceiling. Also, instead of a single cable from a PC to the hub, the equivalent will be created. First, you install a short cable from the PC to a wall plate. The electrician runs another cable from the back of the wall plate to the wiring closet into a patch panel. Finally, either the electrician or the network engineer connects a cable from the patch panel in the wiring closet to the hub. Together, these cables provide two twisted pair between the PC NIC and the hub. Figure $4-13$ shows the major components.

Figure 4-13 Major Components of a Structured Wiring Plan

Structured wiring allows the electrician to take care of the difficult part of cabling, with a minimum of cost, effort, and clutter, while still making sure that the cabling works correctly. Even though multiple cables are used, the net result of the cabling simply needs to ensure that the correct twisted pairs end up at the right place in the connectors at the endpoints. And the only cables that the people in the offices can see are the short ones between the PC and the wall plate; the rest of the cables are hidden.

Imagine that if instead of structured wiring, the electrician simply ran a single cable from the computer, under the floor, and straight into the hub in the wiring closet. Later, the person in the cubicle decides that she wants her PC on the left side of her desk, and she might discover that the cable is too short. So what does she do? She calls the electrician and asks for another cable to be run.

Of course, the electrician probably isn't going to want to run a new cable from the cubicle to the wiring closet. If he had used structured wiring, he could have run a cable from the wall plate to the patch panel in the wiring closet. A patch panel, sometimes called a wiring panel, provides the electrician a place to connect the actual wires in the cable on one side of the panel. On the other side, receptacles, much like the ones in the wall plate in the cubicle, allow the electrician or network engineer to use a short cable to connect those pairs of wires to some other devices, such as the hub shown in Figure 4-13.

Because the patch panel is located in a well-known place, and because the wall plate in the cubicles does not move, the electrician can do the hard part (running the cables under the floor) once. If the PC in the cubicle needs to be moved farther away from the wall, the PC user can get a slightly longer patch cable. A patch cable is simply a short LAN cable. Likewise, inside the wiring closet, short patch cables can be used to connect from the patch panel to the networking device, such as the hub shown in Figure 4-13.

You can think of structured wiring as the equivalent of having the DOT build your roads versus just using dirt roads. It takes time, planning, effort, and more cost, but in the end, you have a much better road system. With structured wiring, you end up with much better wiring and far less clutter. Furthermore, you can make changes without a lot of effort.

The benefits of structured cabling can be summarized as follows:
■ Helps minimize the need for running new cables because the distance from each wall plate to the wiring panel can be determined easily

- Allows PC installers to run a short patch cable from the wall plate to the PC, without requiring help from the electrician
- Allows network engineers to run a short patch cable from the wiring panel to the networking devices, such as a hub

■ Helps keep the wiring closet more organized

## Chapter Summary

Computers communicate by transmitting an electrical signal over wires, with differing electrical characteristics meaning binary 0 and binary 1 . For effective communication, both transmit and receive paths are needed; with a single path, the electrical signals would overlap, confusing the meaning of both electrical signals. Also, a twisted pair of wires is used for transmission in each direction because a twisted pair reduces the impact of electromagnetic interference on the wires, which in turn reduces transmission errors.

LAN UTP cabling includes up to four twisted pairs of unshielded wires, typically terminated with RJ-45 connectors. Although four pairs are supported, only two pairs are needed for Ethernet LAN communications - one pair for each direction of transmission. Depending on which devices are being connected, you might need a cross-over cable or a straight-through cable, ensuring that the pair used for transmission by one device connects to the pair used for receiving data on the other device.

Ethernet hubs allow multiple devices to connect to it, with the result that all devices receive a copy of whatever each device sends to the hub. By doing so, each device needs a single NIC and a single cable connecting it to the LAN hub, while allowing all devices to communicate with all other devices.

Finally, a structured wiring plan helps prevent unnecessary cabling runs inside the difficult-to-reach parts of the physical location (under the floor or in the ceiling). It also allows other personnel to change cabling later, without involving the electrician.

## Chapter Review Questions

You can find the answers to the following questions in Appendix A, "Answers to Chapter Review Questions."

1. Give an example of how a computer might transmit binary 0 s and 1 s using variations in voltage on a wire.
2. Imagine that two computers are sending and receiving data over a wire. How often would the receiving device need to sample the electrical signal on the wire if the standard called for 20 bps transmission speed?
3. As explained in the chapter, do computers usually transmit data over the same wires they use to receive data? Why or why not?
4. As explained in the chapter, do computers usually transmit data over a single wire, or do they use two wires?
5. How many wires can fit inside the end of an RJ-45 connector?
6. How many wires are needed for a PC to successfully send and receive data to another PC using an Ethernet LAN cable with RJ-45 connectors?
7. Explain why a straight-through LAN cable does not work when connecting two PCs directly, just using the cable.
8. Explain why a cross-over LAN cable does work when connecting two PCs directly, just using the cable.
9. Explain why a straight-through LAN cable works when connecting a PC to a hub.
10. What is the main difference between UTP and STP cabling? Which is more popular today?
11. List some of the key benefits of a structured cabling plan.
12. Imagine a hub with ten physical ports, and cables connecting each port to ten different PCs. The hub receives an electrical signal from the PC on port 1. Where does the hub forward the electrical signal?
13. Define the term "pin" in relation to an RJ-45 connector.

name resolution, 216
network analysis tools, 365
network applications
e-mail, 28-31
file read, 18
file transfer, 32-33, 38
file write, 18
web browers, 25-26
network classes, 223-227
network clouds, 21
network engineers, 10
network layer protocols, 59
network number, 222, 226-227
Class A networks, 221
Class B networks, 221
Class C networks, 221
network services, 18
network utilities, 9
networking models, 47
OSI, 57-58
proprietary, 47-48
public, 49
TCP/IP, 50-53
layers, 56-57
networking protocols, 44
networking standards, 37, 40
data transmission, 42-43
electrical interference, 44
error recovery, 45
IEEE, 54
ITU, 55

## networks

Frame Relay VCs, 321
IP
classes, 223-227
subnetting, 227-231
subnetting, 229, 231
next-hop routers, 250
NICs (network interface cards), 39, 65, 212
10/100 cards, 127
autonegotiation, 126-127
Ethernet, 76
loopback circuits, 93

## numbering systems

binary, converting to decimal and hexadecimal values, 450, 456 hexadecimal, converting to decimal and binary values, 95-97, 450, 456

## 0

octets, 212
open networking models, 49
TCP/IP, 50
IP, 52-53
TCP, 50
OS (operating system), 182
OSI reference model, 57-58
application layer protocols, 184
Layer 8, 141
transport layer protocols, 182-183
TCP, 184-201
versus TCP/IP model, 58
outside interfaces, 381

## P

packets, 43-44, 214, 252, 263
acknowledgment numbers, 51
encapsulation, 215
error recovery, 45
forward acknowledgment, 51
headers, 51
IP, 214-216
header, 53
sequence numbers, 51
versus segments, 214

PAP (Password Authentication
Protocol), 362-364
passwords, 356
clear-text, 364
patch panels, 82
PCs (personal computers), 6
phones, comparing with modems, 339-340
physical connectivity, 39
cabling, cross-over, 77
connectors, 40, 74-75
structured wiring plans, 80-82
physical LANs, creating, 134-136
pins, 74
PIX Firewall, 379
point-to-point links, 301
POP (point of presence), 343
POP3, 159, 163
and SMTP, 164
port numbers, TCP, 198
PPP (Point-to-Point Protocol), 308, 344
preamble, 89
print servers, 21
print services, 21
proprietary networking models, 47-48
protocols, 44

PSTN (public switched telephone network), 337
public networking models, 49 TCP/IP, 50

IP, 52-53
TCP, 50
PUT command (FTP), 170
PVCs (permanent virtual circuits), 321, 325

## R

RADIUS, 364
reducing congestion with LAN
switches, 109-111
buffers, 113-114
full-duplex transmission, 115
resolving DNS names to IP
addresses, 216, 283-288
RFCs (requests for comments), 50, 159

RJ-45 connectors, 74
pinout options, 76
root DNS servers, 288
routers, 209
configuring, 264-265
dynamic routes, configuring, 268
forwarding to WAN links, 306
IP, forwarding packets over WAN links, 307-308
next-hop, 250
static routes, configuring, 267
routing, 52, 209-210
assigning IP addresses to interfaces, 264-265
directly connected subnets, 265
end-to-end routing process,
237-238, 253-254
ARP, 240
decapsulation, 248
default gateways, 238
DHCP, 243-244
encapsulation, 240-243
Ethernet framing, 251-252
finding web server MAC address, 255
routing table lookups, 249-251
with subnets, 256-258
IP addresses, 211, 217-220
canonical format, 212
conventions, 221
destination IP address field, 213
hosts, 212
network classes, 223-227
network number, 222
NICs, 212
octets, 212
source IP address field, 213-214 subnetting, 227-231
static IP, 267
routing protocols, 268
metrics, 272-273
routing tables, 53, 247
lookups, 249-251
routing updates, 269-270

## S

security
accounting, 360-361
anti-virus software, 386-387
authentication, 356-357, 362
CHAP, 365-366
PAP, 362-364
with username and password, 356-359
authorization, 359-360
firewalls, 378-380
DMZs, 383
traffic filtering logic, 381-383
identifying allowable traffic on enterprise network Internet connection, 373-378

IDSs, 385
network-based, 385
signatures, 387
VPNs, 368-370
segments, 193
mss, 192
TCP, 187
versus packets, 214
sending email, 155
sequence number field (TCP
header), 189
sequence numbers, 51
serial interfaces, 298
CSU/DSU, 303
serial links, 301
addressing, 309
SEs (sales engineers), 298
signatures, 387
single broadcast domains, 133
single site networks, 6
SMTP (Simple Mail Transfer
Protocol) , 159, 161
and POP3, 164
Sneakernet, 20
sniffers, 365
software, e-mail client, 159
source address field (Ethernet
header), 95, 97-98
source IP address field, 213-214
standards, 37, 40
encoding, 69
Ethernet, 101
networking models, 47
data transmission, 42-45
proprietary, 47-48
public, 49-53
OSI reference model, 57-58
standards bodies
IEEE, 54
ITU, 55
static IP routes, 267
STP (shielded twisted pair), 73
straight-through cables, 77
structured wiring plans, 80-82
subnets, 227-231
directly connected, 265
end-to-end routing process, 256-258
switch ports, 10, 111
switches
autonegotiation, 126-127
creating multiple physical LANs, 134-136
flooding, 118-119
forwarding decisions, 110
Frame Relay, 316
MAC addresses
learning, 117-118
table, 111
reducing congestion, 109-111
buffers, 113-114
full-duplex transmission, 115
supporting multiple speeds, 125
trunking, 143-144, 146
VLANs
creating, 137-138
forwarding decisions, 143
frame forwarding, 139-140
reasons for implementing, 140-142

## SYN flag bit (TCP), 380

## T

T1 lines, 302
TCP (Transmission Control
Protocol), 50, 184, 215, 379
connection establishment, 171, 200-201
error recovery, 187-188, 191
forward acknowledgment, 190
headers, 186
destination port field, 197
port numbers, 198
segmentation, 187, 193
SYN flag bit, 380

TCP/IP, 49-50
DNS, 281-282
name format, 288
name resolution, 283-288
root DNS servers, 288
e-mail standards, 158
IP addressing, 52-53, 221
subnets, 228
local host file, 280-281
networking model
layers, 56-57, 215
versus OSI model, 58
TCP, 50
telcos
COs, 298
Frame Relay service, 319
leased lines, 298-302
SEs, 298
telephone switches, 340
three-site Frame Relay
networks, 323
traffic
filtering with firewalls, 381-383
monitoring with PIX Firewall, 379-380
trailers (Ethernet), FCS field, 99-100
transferring files, 32-33, 38
with FTP, 167, 170-171
transmission speeds

## CIR, 325

of DSL, 348
of modems, 342
of WAN links, 302
transport layer protocols, 58, 181-183

TCP, 184
connection establishment, 200-201
error recovery, 187-188, 191
headers, 186
port numbers, 198
segmentation, 193
segments, 187
trunking, 143-146
802.1Q, 146

ISL, 146
twisted pair cabling, 73
two-part email addresses, 157
types of WANs, 336

## U

unicast MAC addresses, 120
uploading files, 32
URLs (uniform resource
locators), 27, 174
usernames, 356
authentication, 356-359
clear-text, 364
UTP (unshielded twisted pair), 73

## V

VCs (virtual circuits), 321
CIR, 325
vendor consortiums, 318
vendor-proprietary networking
models, 47-48
viruses, 385-387
VLANs, 131
creating, 137-138
frame forwarding, 139-140
reasons for implementing, 140, 142
switch logic, 143
trunking, 143-146
802.1Q, 146

ISL, 146
voice circuits, 337
voltage, 42
VPNs (virtual private networks), 368-370

## W

wall plates, 9
WANs, 11-12, 54
data link framing, 307-308
Ethernet-based, 297
Frame Relay, 315, 319
access links, 317
CIR, 325
DLCIs, 319-320
FCS field, 329
full mesh, 321
Inverse ARP messages, 329
PVCs, 321
routing, 326-327
three-site networks, 323
VCs, 321
verus leased lines, 320, 324
leased lines, 297-302, 336
analog transmission, 339
digital transmission, 338
voice traffic, 337
links, 296, 300
addressing, 309
full-duplex transmission, 304
installing, 305
transmission speeds, 302
serial interfaces, 298
CSU/DSU, 303
types, 336
versus LANs, 295
waveform, 71
web addresses, 27
web browsers, 25-26, 172
web clients, 172
web pages, 26
loading from browsers, 175-176
web servers, 26, 172
websites, 26, 172
well-known ports, 199, 380
wiring closets, 7
wall plates, 9
wiring panels, 9,82
word processing applications, 18
WWW (World Wide Web), 172
